

UPDATED – July 22, 2014

Early indication has shown that the latest version of Java 7 Update 65 has prevented CM/ECF users from being able to log into the CM/ECF system. The log in process stops on a gray or black screen. You can check the Java version that is on your computer by <http://www.java.com/en/download/installed.jsp>

If you are not able to log into CM/ECF due to the Java version, follow these steps to correct the issue.

Click the windows ball in the lower left corner of the screen 

Select "All Programs"

Locate the Java Folder, and single left click.

Select "Configure Java" – The Java Control Panel Should Open (as shown below)

Click the Java tab.

Click the "View.." button to bring up a table

In the table, you should see a line for Java 7 (1.7) that looks something like this:

1.7	1.7.0_65	http://java.s...	C:\jre\bin\javaw.exe		
-----	----------	------------------	----------------------	--	---

In the 5th column, titled "Runtime Parameters" which is probably blank, click once (which will highlight the whole row), then quickly click again to allow "edit" of the blank column (it will change color to non-highlighted, if not, click twice, faster). If there are any parameters in the cell, backspace to erase them. *NOTE:* this procedure only works as intended if it thinks you have edited, so make sure you double click and get the cell selected for editing.

Then click "OK" and "OK" again on the Java Control Panel. This sequence will create a necessary arguments parameter in a properties file on your machine

Close your browsers and retest, you should now be able to launch Appellate with both Firefox and IE.

Note: If you unchecked the NextGen plugin, as recently directed to do so, you should probably re-enable it as shown below.
